Dunnage Bags Level 0

Product information

With dunnage bags it is easy to avoid damages that might occur during transports in containers, railroad cars and on ships. A dunnage bag level 0 is made from an airtight case of polyethylene equipped with an air valve and an outer layer of heavy-duty paper or polypropylene. A safe transport is achived when a right-sized dunnage bag, and correctly located in the cargospace, is inflated with air. The dunnage bag then prevents the cargo from moving on the load carrier and absorbs shocks and vibrations. To efficiently prevent transport damages is not the only advantage with dunnage bags. It is very quick to place and inflate the bags, which decrease the work effort during loading and unloading to a minimum which saves a lot of time. Since the valve can be open och re-closed it is also poosible to reuse the bag for example if a container should be repacked.
